Hutson (2021) points out that AI writers of the present day can produce fluent and human-like text, but their fluent writing can conceal that they showed no real understanding. This is the tension that is at the heart of the consideration of the advantages and disadvantages of AI writers at various levels of application.

On the administrative side, AI will be able to automate the routine process of writing emails, memos, and meeting notes(Parycek, Schmid, and Novak, 2024). The efficiency enables the human personnel to work on high-level work. The risks are not so high in this case, because the outputs can be easily checked and corrected.

In the case of professional or technical writing, AI solutions may be useful in speeding up the text-writing process, organizing a report, or improving the language. Research indicates that large language models (LLMs) have the ability to enhance productivity and confidence in writing as well as confidence in drafting, yet have the potential to decrease writing style diversity and decrease critical interaction with ideas (Li, Liang, Peng, and Yin, 2024). The risk is that the professionals are going to be over-reliant on AI, and the skills will be gradually lost.

AI can write creative tales, poetry, and dialogue, and provide a new source of inspiration in creative writing. Nonetheless, its derivative character is prone to homogenisation of style and inadvertent plagiarism as well as to the continuance of cultural prejudice existing in its teaching information (Glynn, 2024). In addition, overdependence will reduce originality and undermine the human voice in literature.

To address these risks, Hutson (2025) has suggested a more humane effort to integrate AI into their writing, as it serves as a drafting or brainstorming tool, but the final task is still left to human writers. Intelligence and accountability require the AI use to be disclosed openly, the fact-checking process to be strong, and the bias to be audited critically.

Altogether, AI writers may provide efficiency and help people to create, but Hutson (2021) makes it clear that fluency does not equal wisdom, and real authorship must be a human task.

Writing programs based on artificial intelligence (AI) are rapidly becoming more prevalent in a wide range of professional fields, which comes with potential gains on the one hand and natural benefits on the other. On the positive scale, these technologies have a strong performance in regular office management to avoid spending a significant amount of time by creating emails, briefing reports, or completion of a document in a short period, allowing personnel to spend more time on complex and stimulating activities. That is expected near situations when brevity and speed are obligatory, and the error margin decreases as AI automates the delivery and reception of letters and documents, at the same time (Chassang et al., 2021). AI serves as a support activity in learning and research. Its ability to produce ideas and information curation and autumn drafts of essays or reports make it an effective device among those who are journalists and researchers dealing with bulk data. The AI makes the initial writing much faster, adding to productivity and expanding the pool of knowledge (Sok and Heng, 2023). It is possible that the dependence on AI will undermine critical thinking and innovation since the reliance can result in some extinguishing fire of humanity. As an example, AI can generate prose of fluent-level quality that is lacking emotionality, cultural awareness, and spiritual novelty, thus creating the misconception that machine creativity can be better than the human-made one. Further, it is also a big ethical question of discrimination. As something that is being trained on modern data samples, AI systems can continue to spread existent stereotypes attributed to the data they are being trained on, or errors in it (Plathottam et al., 2023). This has a negative impact on academic integrity, some student body may use AI to do academic work so as to prevent personal development of competencies and erudition. Finally, AI writing tools can be effectively utilitarian in case of a thoughtful use. They offer intuitive advantages in terms of efficiency, accessibility and productivity, though, there has to be human perception, innovation and ethical responsibility involved in the application of these.

According to Hutson (2021), the current AI “robo-writers show a high level of fluency and a low level of understanding. This dissonance between form and comprehension makes one need to reason critically on the manner in which such systems are implemented in different writing situations.

According to Baviskar, Dipali, et al. (2021), AI has the potential to be used in regular and administrative operations to computerise the time-consuming aspects of meeting notes, standard mail, or report templates. It can offload human manpower in terms of repetitive work and enhance turnaround time when applied to these low-risk activities. The reason is that these texts can be reviewed easily, hence corrected quickly, which makes this the least disputable field to offer AI assistance.

With more specialised or technical writing, AI systems have a different type of value. They propose the outlines, summarise the convoluted information, or assist with refining the style of business documents (Spring, Faulconbridge, & Sarwar, 2022). Nonetheless, the higher the level of domain specificity of the content, the higher the chance of factual inaccuracy, fabricated references, or implicit biasing. Excessive use of this scale can also result in a decrease in the number of professionals who are analytical and rhetorical in aspects of their work, but who excessively depend on automated drafting (Sutton, Arnold, and Holt, 2018).

The creative writing reflects the potential and the shortcomings of the technology. Prompts, characters, or stylistic experiments that writers get inspired by can be provided by generative models. However, due to the remixing of patterns of existing texts, their results can be derivative and even inadvertently stereotypical or violate originality (Zyska, Dennis, et al. 2023).

In order to mitigate these risks, AI must be seen as an aid, but not a replacement for a writer. Maintaining integrity, creativity, and accountability is gained through having human beings in charge of editing, disclosure, and fact-checking. Applied in this manner, AI can enhance instead of steal the ability and creativity that make real writing.
