I agree with you in the growing usage of AI in writing namely its threats and its benefits in the various domains. Admittedly, AI can perform parts of administrative tasks like writing emails and drafting meeting notes and, therefore, can serve as the means of providing additional time to more complex tasks. This will help in enhancement of efficiency with lean loss as far as quality is concerned. Still, I am also in agreement with the problem of unreal knowledge about AI. The AI can generate a text that is fluent by nature, but the human cognition is not so profound, and it results in the generation of a text not only featuring the meaning on its own but also being original (Glynn, 2024). The application of AI in professional or technical writing, as you pointed out, is certain to rise in productivity and even assist in creating and organizing the papers. This could, however, bring about the over-trust of AI lowering the degree of critical thinking and imaginativeness. The articulation of the idea of AI running efficiency written work is valid and it is prudent that it is not replacing the valuable amount of human effort especially in the more complicated work. The other authentic type of concern is the loss of writing variety to the one that is being produced by AI technology and therefore lead to a homogenization of writing (Parycek, Schmid, and Novak, 2024). In the case of creative writing, any inspiration process, as well as even the generation of preliminary assemblers, can occur thanks to AI, provided it is relevant that the human writers can control the vehicle in the creation of a final product. AI has some potential to reproduce biases or to be unable to reach the complexity of human emotion and originality. Herein lies the significance of human input in the artistic process (Li, Liang, Peng, & Yin, 2024). Conclusively, AI can be a useful guiding tool but humanity takes its intelligent and creative and critical involvement in giving the final product its natural and richness.

Reply to Peer Response Yousif Almazami:

I agree with the point of view concerning the increased place of AI in the professional world and the capacity to not only boost output, but also prompt anxieties. The productivity that AI is availed including in the administrative aspect such as email and report creation simply cannot be ignored. It enables the personnel to work on more sophisticated tasks and enhances productivity as you mentioned. AI saves time that would be used to carry out repetitive tasks since it automates these activities and hence the saved time can be used to address other needs of the human resource which are more important. Nevertheless, I also agree with you the fact that too much reliance on AI may reduce innovation and argument. The use of AI will ensure that the writing process enters a new time, but it cannot leave the depth and emotional connection that human authors apply their work behind (Chassang et al., 2021). The AI-generated content does not reflect that clear insight into the human experience, culture, and creativity that can be introduced by a human in writing. Another critical move that should be considered is whether AI will only recreate the existing biases, which is a crucial problem that needs to be tackled, especially in academic or research-related activities, by which the integrity of the information is the primary concern (Sok & Heng, 2023). In addition, the ethical issues of the application of AI in the academic establishment are legitimate. This can be abused as explained by you, where the AI can be used, even by the students, to produce essays or appointments, which can deepen their writing and analytical capabilities. The convenience of AI can pose a risk to personal development and lower the education quality (Plathottam, Rzonca, Lakhnori, & Iloeje, 2023). Thus, although AI can have significant potential in increasing efficiency and saving people in terms of creativity, it should be applied to people responsibly and efficiently. In conclusion, human decision-making and supervision will be needed to make sure AI becomes an assistant, not a walking stick restraining creativity and personal growth.

Reply to Peer Response Saleh Almarzooqi:

I support your review of the contribution of AI to writing and the danger of its continued growth. The capacity of AI to produce fluency in text without necessarily possessing an understanding is a fundamental query as you explained. Even though, artificial intelligence can be used in other functions like summarizing and writing one or another word kind of report, AI has no actual knowledge and does not have any intestinal feelings thus, it offered no benefits when having to complete a task that needs favorable vision such as literary writing or technical examination. The violation of connection between fluency and awareness is particularly common with the use of AI in courses that require a more specialized writing style, as such that prioritizes all types of accuracy of facts in the form of accuracy and critical evaluation as the most essential issue (Zyska et al., 2023). The idea of the prospect of AI rendering professionals obsolete when it comes to critical thinking and rhetoric is a valid point, according to your suggestion. In areas where professional writing or research is one of the core styles as it is in the case of the technical writing career, too much reliance on AI would lead to the collapse of these essential abilities (Spring, Faulconbridge, and Sarwar, 2022). Artificial intelligence may also assist in developing the required material at a rapid pace, though the risk is that the same AI may cause quickly the consideration of the mental and innovative aspect of working on the material and the element of interaction of the material by a person. Prejudice and lack of facts can also gain prominence especially in extremely specialized fields in which experience is needed. One of the areas that AI is helpful in generating concepts and/or even trying to provide one with inspirational potential of style, it can be seen that even now the logo must be built with a human mind (Baviskar et al., 2021). I wholly agree with your opinion that AI is something that can assist writers and not substitute them.
