

✓ **Done:** Make a submission

**Due:** Monday, 17 November 2025, 11:55 PM

You can submit a brief outline of your review by the end of this unit to receive formative feedback from your tutor. Your submission should only highlight your plan for the Literature Review.

See Unit 7 submission portal for full assignment details.

This assignment is formative and not graded.

This submission is not blind marked.

1. Knowledge and Understanding of the Topic

Your outline demonstrates a clear understanding of digital health systems in the UAE including EMRs, HIEs, telemedicine, and AI-supported decision support systems. The outline clearly situates these systems within national digital health strategies and identifies the potential impact on the transformation of health care. The outline demonstrates awareness of the technical and socio-technical dimensions of the systems. That said, the outline could emphasize a bit more of sufficient empirical evidence on outcomes, such as patient safety, efficiency, or access metrics.

2. Critical Thinking

The outline indicates good critical engagement since you highlight intended comparison of the adoption studies, the methodologies, and the limits. The outline also indicates strong critical thinking since you intend to use theoretical frameworks (TAM, UTAUT, socio-technical lenses) to make sense of the findings. You clearly identify gaps in real-world assessments of impact and methodological rigor. To demonstrate critical thinking, you might want to indicate a bit more around how you will make sense of conflicting evidence and how you will assess the implications for practice and policy.

3. Use of Relevant Sources

You have already listed several high-quality, recent sources, including empirical studies and official documents/reports that demonstrates you are aware of the the relevant literatures, which becomes a strong foundation for articulating the rationale for your study. The outline would be strengthened to indicate that additional grey literature, case studies, or comparative studies in the regional literature, may also supplement as part of the evidence base.

4. Structure and Presentation

The structure is apparent and logically organized: introduction, policy context, system uptake, evaluative theme, critical synthesis, and conclusion. Subheadings identify regions of focus. Minor enhancements could include summarizing methodological approaches with a little more brevity and explicit connections or transitions between sections to further bolster narrative flow.

5. Academic Integrity

The outline has drawn on theoretical frameworks, peer-reviewed journal articles, and official reports or governmental policy papers, demonstrating an engagement with rigorous scholarship. The outline identifies areas of methodology, how literature was searched, inclusion criteria, and source evaluation, thus opening up a level of transparency. To strengthen the rigor of the outline, it could elaborate on how quality appraisal will be conducted for each study.

The outline looks very appealing, but there are areas that could be strengthened and that would make the review even more substantive. Bringing in some tangible measures of impact how do these information systems lead to efficiency, patient experience, or safety improvements would be more helpful than staying at the theoretical level. The methodology could certainly be fleshed out more fully and in particular clarify how each study would be evaluated for quality and relevance. More regional or international comparisons would allow for more context, and convey how practices in the UAE fit into larger trends. The critical synthesis phase could better articulate how to deal with conflicting findings and draw implications for policymakers and practitioner. Finally, more explicitly connecting the theoretical frameworks to outcomes for real-world practice and experiences of stakeholders would help the review feel grounded and aligned to the practical.
