Use of AI-powered composition tools is manifesting itself with the kind of ubiquity it has in everyday and work-related routines that I have been witnessing as a result of a set of perceived advantages and a mix of perceived disadvantages. These systems can perform administrative inputs, such as gang-rote administrative tasks, like emailing, report-summaries, or document generation, which in turn frees human agents to apply higher-order decisions, focusing on creative problem-solving (Chustecki, 2024). Within the business environment, AI can provide the organisations focused on efficiency in their operations and transparency; it may standardise the conversation within the organisation and reduce human error (Chustecki, 2024). AI has also been used in the academic and research of subjects realizing the idea, organizing the material and drafting provisional theories, which make them easier to understand and have learners interact more with intricate information (Berry and Kotha, 2024). Excessive use of AI could undermine critical thinking and originality skills and the level of analytical rigor among humans. In fiction writing, although AI may be able to parrot stylistic elements and be able to produce surrounding language that makes sense, it often lacks depth, emotionality, and the specificity necessary to engage the reader comprehensively that sufficiently at least, one might validly questions whether AI is compressing human intellect (Kouloukoui et al., 2025). Another urgent problem is discrimination. Since AI systems are trained on large scale corpora, they can reproduce aspects of established stereotypes or spread misinformation, without careful supervision, they tend to increase negative discourses in news media, literature, or academic resources (Lee et al., 2023).

Dear ali

Many thanks for an illuminating post on the growing normalization of corporate, educational, and artistic AI-powered writing tools. We made the point (more than once) that the same technology can be incredibly efficient, but at the same time difficult for people (or humanity) to address key human capabilities (originality, critical thinking, etc). In terms of creativity, I was really taken by the implications you made of AI "reducing the complexity of the human mind", in the way that it threatens to reduce the diversity of human emotions as well as the cultural diversity of what we write about (Bozkurt, Aras, et al., 2024).

Speaking of which, one great way of finding the balance between efficiency and originality is to adhere to explicit usage policies. Organisations could, meanwhile, require that an independent human review any email or report produced by AI algorithms to ensure that it does not lead to unaudited decision-making (Tiron-Tudor, and Deliu, 2022). This

[Chat to us!](#)

the preservation of accountability and, with it, productivity gains on the administrative front going in. In the classroom, for instance, educators might ask the students and researchers to report on which AI tools they have worked on, to critique whatever the product of AI is, which would serve to make AI a learning tool rather than a replacement for analysis.

Some authors of creative works are already combining AI-generated drafts with their own "depth edits" to enhance the work's emotional depth, cultural specificity, and distinctive narrative structures. And doing so would allow the fire to be saved without robbing people of their voices (Mazzi, 2024). Finally, it would be beneficial to include regular audits of bias as part of an organization's and/or publication's process, or to look for additional tools that would flag harmful stereotypes prior to publication, given the concern you raise regarding the risk of bias and false claims (Benoit, 2025).

It means equally, as you correctly point out. Describe the advantages and disadvantages of AI. If we forego careful control and disclosure of its workings, AI will not improve human creativity and judgment.

Your post provides a good summary of the practical benefits and the more profound dangers of the AI-powered tools for composition. I was particularly drawn to the insights shared on how AI can contribute to efficiency within both organisations and academia. I also love your mention of discrimination and perpetuation of stereotype (which is under-emphasised sometimes in the discussion of productivity benefits) here.

Building on your analysis, I think an important next step is to think of specific safeguards that could be implemented to mitigate the risks you identify. For instance, in workplaces, a system of double approval can be installed in which the outcome created through AI must be reviewed by at least one human supervisor before it is released as a report or a communication (Tsamados, Floridi, and Taddeo, 2025). This will maintain efficiency while ensuring critical thinking and originality. At the scholarship level, instructors can create studying tasks that ask students to explore and critically assess any AI-generated content they use, which, in addition to enforcing educational integrity, helps the learner consider how AI is influencing their thinking (Seghier, 2025).

In fiction or creative writing, a possible guardrail is using AI-generated drafts in tandem with human-driven "depth editing" sessions, during which authors carefully add emotional depth, cultural specificity, and original narrative arcs (Lanz, Briker, & Gerpott, 2024). This ensures that AI remains an inspirational tool for human creativity, rather than a substitute.

Overall, your post highlights the main tension posited - fluency without understanding. By incorporating disclosure, bias audits, and human review into workflows, the good and the bad of AI can be harnessed by organisations and individuals, while mitigating or reproduction of stereotypes.

I entirely agree with your view concerning the greater involvement of AI into the professional world and an overall opportunity to promote the productivity of professional and raise certain worries. The AI level of productivity can barely be disregarded when it comes to delivering corporate level services like email generation and report generation. It gives the personnel the ability to concentrate in the more complex tasks and elevates productivity. If every day processing is performed by robots, the time is saved that is spent on similar operations, and people can be used in other more significant spheres. I do have reservations about our over-reliance on AI, however, I agree that creative thinking and thinking may be eroded. Though the AIs are able to drastically increase the speed of the writing process, they cannot substitute the depth and emotional appeal with which human writers can inform their text. Besides, ethical issues related to AI use in the academia are legitimate. The benefits of AI could be that it helps to produce content faster, however, there is a danger of the intellectual stimulus and creativity resulting when a person works with the material fading. The students can also use AI to produce essays or assignments in a wrong way, which makes me feel that it could lead to a situation when their writing and critical thinking could be underdeveloped because they are too unaccustomed to producing original texts. The lack of personal development due to convenience is the temptation that may impair the standards of education as a whole. Thus, there are significant opportunities of AI in improving efficiency, and helping creativity, however, it should be applied responsibly and ethically. Finally, the role of human judgment and control is also necessary to make sure the AI can be used as an assistant but not a crutch that will make innovations and personal growth stop.
